# Posledná prednázka

(informatívna)

Tri témy (nijako nesúvisiace):

- backtracking. ako forma preh adávania stavovéo priestoru (grafu),
- reflexivita. nie o nevídané v kompilovaných jazykoch,
- "funkcionálna java 1.8. funkcionálne programovanie u0 aj Jave (od 1.8)

Závere né slovo

# DFS/BFS/Bactracking

Ide o preh adávanie stavového priestoru, abstrakcia pre stav mô0e by :

```
interface State {
   public State();
                                        // počiatočný stav hľadania
   abstract boolean isFinalState();  // test na koncový stav hľadania
                             // nasledujúci/susedný stav
   abstract State[] next();
   abstract boolean isCorrect();  // test na korektnosť stavu
}
                                                         State(5).next()
Naivné preh adávanie pre acyklický graf, ktoré sa na cyklickom zacyklí
public class Search<S extends State> // hľadáme cestu do finálneho stavu
public void searchWhichLoops(S s) {
   if (s.isFinalState())
        add(s);// pridaj do zoznamu riešení
   else
        for (State ns : s.next())
           search((S) ns); // rekurzia do susedov
```

# Aby sa to nezacyklilo

(objavila Ariadna pri h adaní Thezea v labyrinte s Minotaurom)

```
public void search(S s, ArrayList<S> visited) {
  if (s.isFinalState())
       add(s); // pridaj do zoznamu riešení
  else
       for (State ns : s.next()) {
              if (!visited.contains(ns)) {// nebol si ?
                      visited.add((S) ns); // označ
                      search((S) ns, visited);
                      visited.remove(ns); // odznač
```

BTW, je to depth-first alebo breadth-first?

# Backtracking

(orezáva podstromy ur ite neobsahujúce riezenie)

```
public void search(S s, ArrayList<S> visited) {
   if (s.isFinalState())
       add(s);
   else
       for (State ns : s.next()) { // môže to viesť k riešeniu ?
               if (!visited.contains(ns) && ns.isCorrect()) {
                       visited.add((S) ns); // označ
                       search((S) ns, visited);
                       visited.remove(ns); // odznač
               }
¥ikovný isCorrect výrazne zredukuje zvä za
exponenciálny priestor stavov, ale ten aj tak
zostane exponenciálny
Preto: backtrack nepou0ívame na neexponenciálne problémy
```

# Ako by vyzeral BFS

```
private void search(ArrayList<S> queue, ArrayList<S> visited, boolean DFS) {
  while (queue.size() > 0) {
       S s = queue.remove(0); // vyber prvý z fronty
       if (s.isFinalState()) // ak si už v cieli
              add(s);
                                // pridaj do zoznamu riešení
       else
          for (State ns : s.next()) {
            if (!visited.contains(ns) && ns.isCorrect()) {
               visited.add((S) ns);
               if (DFS)
                                   // ak depth-first search
                  queue.add(0, (S) ns); // pridaj na začiatok fronty
               else
                                   // ak breadth-first search
                  queue.add(queue.size(), (S) ns);// pridaj na koniec
```

# n-tice s prvkami 0..(k-1)

```
class NTuple implements State, Cloneable {
                                                             {1,0,2, , }
   int n; // dĺžka n-tice
   int k; // prvky n-tice sú 0..k-1
  ArrayList<Integer> v; // prvky n-tice
   public NTuple(int n, int k) { ...
                                             {1,0,2,0, }
   public boolean equals(Object o) { ...
   public boolean isFinalState() { return v.size() == n; }
   public NTuple[] next() {
    HashSet<NTuple> next = new HashSet<NTuple>();
                                                    {1,0,2,1, }
    for(int i=0; i<k; i++) {
      NTuple s = new NTuple(n,k);
      s.v = (ArrayList<Integer>)v.clone();
                                                              {1,0,2,<mark>2</mark>, }
      s.v.add(i);
      next.add(s);
   return next.toArray(new NTuple[]{});
public boolean isCorrect() { return true; }
```

## Aplikovaná kombinatorika

(rôzne verzie isCorrect)

dostaneme <u>n-prvkové variácie s opakovaním</u>,  $k^n = 8^5 = 32768$ 

```
{8*8*8*8*8}
```

```
public boolean isCorrect() {
   return new HashSet(v).size() == v.size(); // v je množina
   dostaneme <u>n-prvkové variácie s bez opakovania</u>, n*(n-1)*..*(n-k+1)=8*7*6*5*4 = 6720
int size = v.size();
Integer last = v.get(size-1); // prepíšeme hrozný test na opakujúce prvky
return (size == 0 || v.indexOf(last) == size-1); // posledný sa už nachádza ?
return (size < 2 | v.get(size-2) < v.get(size-1)); // prvky sú ostro-rastúce
   dostaneme <u>k-prvkové kombinácie bez opakovania</u>, \binom{k}{n} = \binom{8}{5} = 56
return (size < 2 | v.get(size-2) <= v.get(size-1)); // prvky sú neklesajúce
   dostaneme <u>k-prvkové kombinácie s opakovaním</u>, \binom{n+k-1}{k-1} = \binom{5+8-1}{8-1} = 792
```

<sup>&</sup>quot; ak n=k, tak sú to <u>permutácie</u>, n! = 5! = 120.

#### 8-dám

(zmena len v isCorrect)

```
Sta í len zmeni isCorrect
 public boolean isCorrect() {
                          int size = v.size();
                          Integer last = v.get(size-1); // posledná dáma neohrozuje predchádzajúce
                           for(int i = 1; i <= size-1; i++)
                                                                   if (v.get(size-i-1) == last | | // sa nesmie stretnúť s inou v riadku
                                                                                                 v.get(size-i-1) == last + i || // ani na uhlopriečke
                                                                                                 v.get(size-i-1) == last - i) // ani na druhej uhlopriečke
                                                                                                                                     return false; // ak to nastane, nikdy z toho nebude riešenie
                         return true; // inak je to zatiaľ korektné čiastočné riešenie
[[2, 4, 7, 3, 0, 6, 1, 5], [2, 4, 1, 7, 0, 6, 3, 5], [2, 4, 1, 7, 5, 3, 6, 0], [2, 4, 6, 0, 3, 1, 7, 5], [2, 6, 1, 7, 4, 0, 3, 5], [2, 6, 1, 7, 5, 3, 0, 4], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 1, 7, 4, 6, 0], [2, 4, 1, 7, 5, 3, 0, 4], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 1, 7, 4, 6, 0], [2, 4, 1, 7, 5, 3, 0, 4], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 1, 7, 4, 6, 0], [2, 4, 1, 7, 5, 3, 0, 4], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6, 1], [2, 5, 3, 0, 7, 4, 6], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7, 4], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0, 7], [2, 5, 3, 0,

  nxt.add(new ZabkyState(z6.replace("_><", "<>_"))); // Yavá cez pravú
  nxt.add(new ZabkyState(z6.replace("><_", "_<>"))); // pravá cez ľavú
  nxt.remove(this); nxt.remove(this);
  return nxt.toArray(new ZabkyState[]{});
```

### Reflexivita

(Java Reflection Model)

- mo0nos íta , vykonáva , resp. modifikova program, ktorý sa práve vykonáva
- je to vlastnos, ktorá sa vyskytuje v interpretovaných jazykoch, napr. exec a eval v Pythone, nie v kompilolvaných (v skuto ných) jazykoch ako C, C++)

Pre o??

#### JAVA poskytuje

- Introspection: triedy Class a Field pre ítanie vlastného programu
- Reflexívne volanie: triedy Method, Constructor

#### Nadtrieda a Podtrieda

(ilustra ný príklad)

```
public class Nadtrieda implements Runnable {
           public int variabla;
           public int[] pole = {1,2,3};
           public String[] poleStr = {"janko", "marienka" };
           public Nadtrieda() {
           public Nadtrieda(int a) {
           public void Too(double r) {
           public void run() { ... kvôli Runnable ... }
        public class Podtrieda extends Nadtrieda {
               public Podtrieda(String s) { }
               public class Vnorena { }
               public interface Prazdny {}
```

## Trieda Class<T>

Kaÿdý objekt pozná metódu getClass():

Class nt = new Nadtrieda().getClass();

#### Class:

"hodnotou sú reflexívne obrazy tried náýho programu,  $S = \{X | X \notin X\}$ "umoÿní nám íta a spúý a asti náýho programu, "o.i. pozná metódu String getName()

Russellov paradox (antinómia)

$$= \{X | X \notin X\}$$

// Trieda.class

// Nadtrieda System.out.println(nt.getName());

Class nt1 = Nadtrieda.class;

System.out.println(nt1.getName()); // Nadtrieda

#### "meta-trieda:

Class klas = Class.class: Class klas1 = nt.getClass();

#### Trieda Class<T>

e.printStackTrace();

```
try {
                                                   // forName(Í Å Î )
        Class pt = Class.forName("Podtrieda");
        System.out.println(pt.getName());
                                                   // Podtrieda
        Class nt2 = pt.getSuperclass();
                                                   // getSuperClass()
        System.out.println(nt2.getName());
                                                           // Nadtrieda
        for(Class cl:pt.getClasses())
                                                   // getClasses()

```

#### Je inztanciou

cl.isInstance(obj) je true, ak obj je inztanciou triedy reprezentovanie v cl.

Class nt = new Nadtrieda().getClass();

nt.isInstance(new Nadtrieda()) == true

class1.isAssignableFrom(class2) je true ak trieda reprezentovaná class1 je nadtriedou/nadinterface triedy reprezentovanej class2, teda do premennej typu reprezentovaneho class1 mô0eme priradi objekt typu reprezentovaného class2.

Ergo:

cl.isAssignableFrom(obj.getClass()) == cl.isInstance(obj)

# Prístup k premennej

```
if (Integer.class.isAssignableFrom(Integer.class)) { // true
  Nadtrieda o = new Nadtrieda();
  Field f = o.getClass().getField("boxedInt");
  f.setAccessible(true);
  f.set(o, new Integer(88));
                                                 // o.boxedInt = 88:
  System.out.println(f.get(o));
                                                 // o.boxedInt:
if (int.class.isAssignableFrom(int.class)) { // true
  Nadtrieda o = new Nadtrieda();
  Field f = o.getClass().getField("variabla");
  f.setAccessible(true);
  f.set(o, new Integer(66));
                                                 // o.variabla = 66:
  alebo
  f.setInt(o, 77);
                                                 // o.variabla = 77:
  System.out.println(f.get(o));

# Historické jadro KSP.sk

(ro níky 1-5 z dnezných 35)

# Organiza ne

- oprava quad-midtermov v H3, prídite bez registrácie v AISe,
- na preplnený termín 15.6. bude rozzírený . p.Gyarfaz ponúkol pár miest v H6
- " v ase 3.-12.6. som mimo, bez javovátka, asi ani nebudem odpoveda na maily,
- preto pízte na prog4java@, sná vás niekto obslú0i,
- moje projekty, ktoré chcú prís na skúzku 15.6. opravím/obodujem ur ite do 14.6., tak0e body za projekt budú, ale feedback ni moc...
- Kurz bol aký bol, ale ve ká v aka celému tímu: Peter, Juraj, Andrej, Patrícia, Jozef.
